

MUSIC TUNER

Abstract of the Disclosure

5 A music tuner having both a contact sensing device and
a non-contact sensing device to pick up the sound from a
music instrument is so designed that it can automatically or
manually select one of the sensing devices that is most
suitable to the situation where the music tuner is used.
The display screen of the music tuner is freely rotatable
10 and pivotable, thereby allowing optimum view angle wherever
the music tuner is placed. The display screen is configured
to graphically represent the tune of the music instrument so
that the user can easily and intuitively grasp the pitch of
the sound as compared with a standard pitch. The music
15 tuner is able to display the result by a normal display
mode, a mirror display mode, or a combination of both modes.
